Subject description

The subject provides students a holistic view of navigating through data science for brining innovation into the real-life problems. Participants acquire relevant technical skills in a comprehensive manner starting from exploratory data analysis, data visualisations leading to understanding of target prediction feature category and selection of ML based on the analysis. This is followed by regression and classification analysis. While getting hands on to the core applied machine learning, students are also introduced to the agile methodology for running a controlled ML experiment. Finally, students are introduced to techniques to save the trained models and then load the trained models in production environment.

Notes

This subject is only available via UTS open as microcredential subjects and is not suitable for enrolled MDSI students.

Learning and teaching activities

Starting from an elemental perspective on data and data science, students will approach learning from their specific professional and potential future contexts. As the subject progresses, the students will be able to combine their analytical and technical skills in developing and applying various machine?learning algorithms, as well as to consider standards and ethical implications of their work.

UTS acknowledges the Gadigal people of the Eora Nation, the Boorooberongal people of the Dharug Nation, the Bidiagal people and the Gamaygal people, upon whose ancestral lands our university stands. We would also like to pay respect to the Elders both past and present, acknowledging them as the traditional custodians of knowledge for these lands.
